

Custom Integration

Getting Started

This PHP integration pack will allow you to implement the payzone payment gateway into your site, using the preferred method for integration.

As part of the integration pack, you will also receive the below documents:

- Getting started pack - non technical overview, to help decide on the best integration method
- Detailed overviews - technical overview of each integration method - useful for customising the integrations
- Test card details pack - document detailing the test card details that can be used with the test accounts

This module is designed to be flexible to connect with your e-commerce / payment system as required - please follow the steps below to install, configure and test this module.

Installation & Setup

To install the payment gateway:

1. Upload the files to the server via FTP
2. In the assets/includes/payzone_gateway.php file, inside the construct() function update the set statements with your merchant details
 - Merchant ID - this can be found in the <https://mms.payzoneonlinepayments.com/Login.aspx> under Account Admin -> Gateway Account Admin
 - Merchant Password - this can be reset in the <https://mms.payzoneonlinepayments.com/Login.aspx> under Account Admin -> Gateway Account Admin
 - Pre Shared Key - this can be found in the <https://mms.payzoneonlinepayments.com/Login.aspx> under Account Admin -> Account Settings
 - Secret Key - This is a unique string for use by the site, you can create any random string
 - Hash method - this can be found in the <https://mms.payzoneonlinepayments.com/Login.aspx> under Account Admin -> Account Settings
 - Integration Type - this depends on your configuration and which option is best suited to meet your needs
3. Click on one of the Submit options below, depending on whether you want to submit with dummy data, or manually enter test details
4. Once you have successfully tested you can start integrating with your system, recording the transaction into your transaction log, and getting / setting the configuration values using your sites database

Notes

Before any customisation of the code, please ensure you complete a test with just the merchant information being entered to ensure there are no conflicts with the server / hosting.

FAQS

Q - Do I need to be registered with PayZone UK to use this Plugin?

A - Yes, you need to be registered and set up as a merchant with PayZone UK. You can find out more at www.payzone.co.uk

Q - Where do I get the Merchant ID and Password from?

A - You will get these details in your registration email

Q - I get error 500 when I try to submit a payment?

A - This is most likely due to outgoing port 4430 being closed, please speak to your hosting provider who will be able to help to open this port.

Q - I get a 'Hash digest does not match' error?

A - Please check the information that has been entered in the config page, please note that the password and key fields are case sensitive, and take care to avoid any preceding or trailing spaces when copying.

Q - Where do I get the Pre Shared Key from?

A - Your Pre Shared Key is available in your Merchant Management System (MMS)

Q - Which Hash method should I use?

A - The Hash method is available & changeable in your Merchant Management System (MMS)

Q - What result delivery method should I use? POST or SERVER_PULL?

A - Choosing the POST method will deliver the full results via the customer's browser as a form post back to the CallbackURL. The downside is that if the user is not on a secure connection (SSL / HTTPS) then the browser will display a warning message to the user around sending sensitive data

A - Choosing the SERVER_PULL, the results are PULLED FROM the payment form by the merchant's system AFTER the customer has been redirected back to the website. This has the advantage of getting around the modern security warning if you're not using secure connection (SSL / HTTPS)

Q - Transactions are failing with no error message

A - Please check that the amounts are over the £1.00 minimum
